THIO ACID DERIVED MONOCYCLIC *N*-HETEROCYCLICS AS ANTICOAGULANTS

Field of the Invention

The present invention is directed to monocyclic *N*-heterocyclics which are substituted by acyclic and cyclic thio acid derivatives, and their pharmaceutically acceptable salts, which inhibit the enzyme, factor Xa, thereby being useful as anti-coagulants. It also relates to pharmaceutical compositions containing the derivatives or their pharmaceutically acceptable salts, and methods of their use.

BACKGROUND OF THE INVENTION

Factor Xa is a member of the trypsin-like serine protease class of enzymes. A one-to-one binding of factors Xa and Va with calcium ions and phospholipid forms the prothrombinase complex which converts prothrombin to thrombin. Thrombin, in turn, converts fibrinogen to fibrin which polymerizes to form insoluble fibrin.

In the coagulation cascade, the prothrombinase complex is the convergent point of the intrinsic (surface activated) and extrinsic (vessel injury-tissue factor) pathways (*Biochemistry* (1991), Vol. 30, p. 10363; and *Cell* (1988), Vol. 53, pp. 505-518). The model of the coagulation cascade has been refined further with the discovery of the mode of action of tissue factor pathway inhibitor (TFPI) (*Seminars in Hematology* (1992), Vol. 29, pp. 159-161). TFPI is a circulating multi-domain serine protease inhibitor with three Kunitz-type domains which competes with factor Va for free factor Xa. Once formed, the binary complex of factor Xa and TFPI becomes a potent inhibitor of the factor VIIa and tissue factor complex.

Factor Xa can be activated by two distinct complexes, by tissue factor-VIIa complex on the "Xa burst" pathway and by the factor IXa-VIIIa complex (TENase) of the "sustained Xa" pathway in the coagulation cascade. After vessel injury, the "Xa burst" pathway is activated *via* tissue factor (TF). Up regulation of the coagulation cascade occurs *via* increased factor Xa production *via* the "sustained Xa" pathway. Down regulation of the coagulation cascade occurs with the formation of the factor Xa-TFPI complex, which not only removes factor Xa but also inhibits further factor formation *via* the "Xa burst" pathway. Therefore, the coagulation cascade is naturally regulated by factor Xa.

The primary advantage of inhibiting factor Xa over thrombin in order to prevent coagulation is the focal role of factor Xa versus the multiple functions of thrombin.

Thrombin not only catalyzes the conversion of fibrinogen to fibrin, factor VIII to VIIIa, factor V to Va, and factor XI to XIa, but also activates platelets, is a monocyte chemotactic factor, and mitogen for lymphocytes and smooth muscle cells. Thrombin activates protein C, the *in vivo* anti-coagulant inactivator of factors Va and VIIIa, when bound to thrombomodulin. In circulation, thrombin is rapidly inactivated by antithrombin III (ATIII) and heparin cofactor II (HCII) in a reaction which is catalyzed by heparin or other proteoglycan-associated glycosaminoglycans, whereas thrombin in tissues is inactivated by the protease, nexin. Thrombin carries out its multiple cellular activation functions through a unique "tethered ligand" thrombin receptor (*Cell* (1991), Vol. 64, p. 1057), which requires the same anionic binding site and active site used in fibrinogen binding and cleavage and by thrombomodulin binding and protein C activation. Thus, a diverse group of *in vivo* molecular targets compete to bind thrombin and the subsequent proteolytic events will have very different physiological consequences depending upon which cell type and which receptor, modulator, substrate or inhibitor binds thrombin.

Published data with the proteins antistasin and tick anti-coagulant peptide (TAP) demonstrate that factor Xa inhibitors are efficacious anti-coagulants (*Thrombosis and Haemostasis* (1992), Vol. 67, pp. 371-376; and *Science* (1990), Vol. 248, pp. 593-596).

The active site of factor Xa can be blocked by either a mechanism-based or a tight binding inhibitor (a tight binding inhibitor differs from a mechanism-based inhibitor by the lack of a covalent link between the enzyme and the inhibitor). Two types of mechanism-based inhibitors are known, reversible and irreversible, which are distinguished by ease of hydrolysis of the enzyme-inhibitor link (*Thrombosis Res* (1992), Vol. 67, pp. 221-231; and *Trends Pharmacol. Sci.* (1987), Vol. 8, pp. 303-307). A series of guanidino compounds are examples of tight-binding inhibitors (*Thrombosis Res.* (1980), Vol. 19, pp. 339-349). Arylsulfonyl-arginine-piperidine-carboxylic acid derivatives have also been shown to be tight-binding inhibitors of thrombin (*Biochem.* (1984), Vol. 23, pp. 85-90), as well as a series of arylamidine-containing compounds, including 3-amidinophenylaryl derivatives (*Thrombosis Res.* (1983), Vol. 29, pp. 635-642) and bis(amidino)benzyl cycloketones (*Thrombosis Res.* (1980), Vol. 17, pp. 545-548). However, these compounds demonstrate poor selectivity for factor Xa.

European Published Patent Application 0 540 051 (Nagahara *et al.*) describes aromatic amidine derivatives which are stated to be capable of showing a strong anticoagulant effect through reversible inhibition of factor Xa.

- 5 The synthesis of α,α' -bis(amidinobenzylidene)cycloalkanones and α,α' -bis(amidinobenzyl)cycloalkanones is described in *Pharmazie* (1977); Vol. 32, No. 3, pp. 141-145. These compounds are disclosed as being serine protease inhibitors.

Utility and Administration

5 A. Utility

The compounds of the invention are inhibitors of factor Xa and therefore useful in disease-states characterized by thrombotic activity based on factor Xa's role in the coagulation cascade (see Background of the Invention above). A primary indication for the compounds is prophylaxis for long term risk following myocardial infarction.

10 Additional indications are prophylaxis of deep vein thrombosis (DVT) following orthopedic surgery or prophylaxis of selected patients following a transient ischemic attack. The compounds of the invention may also be useful for indications in which coumarins are currently used, such as for DVT or other types of surgical intervention such as coronary artery bypass graft and percutaneous transluminal coronary angioplasty.

15 The compounds are also useful for the treatment of thrombotic complications associated with acute promyelocytic leukemia, diabetes, multiple myelomas, disseminated intravascular coagulation associated with septic shock, purpura fulminans associated infection, adult respiratory distress syndrome, unstable angina, and thrombotic complications associated with aortic valve or vascular prosthesis. The
20 compounds are also useful for prophylaxis for thrombotic diseases, in particular in patients who have a high risk of developing such disease.

In addition, the compounds of the invention are useful as *in vitro* and *in vivo* diagnostic reagents for selectively inhibiting factor Xa without inhibiting other components of the coagulation cascade.

B. T sting

The primary bioassays used to demonstrate the inhibitory effect of the compounds of the invention on factor Xa are simple chromogenic assays involving only serine protease, the compound of the invention to be tested, substrate and buffer (see, *e.g.*, *Thrombosis Res.* (1979), Vol. 16, pp. 245-254). For example, four tissue human serine proteases can be used in the primary bioassay, free factor Xa, prothrombinase, thrombin (IIa) and tissue plasminogen activator (tPA). The assay for tPA has been successfully used before to demonstrate undesired side effects in the inhibition of the fibrinolytic process (see, *e.g.*, *J. Med. Chem.* (1993), Vol. 36, pp. 314-319).

Another bioassay useful in demonstrating the utility of the compounds of the invention in inhibiting factor Xa demonstrates the potency of the compounds against free factor Xa in citrated plasma. For example, the anticoagulant efficacy of the compounds of the invention will be tested using either the prothrombin time (PT), or activated partial thromboplastin time (aPTT) while selectivity of the compounds is checked with the thrombin clotting time (TCT) assay. Correlation of the K_i in the primary enzyme assay with the K_i for free factor Xa in citrated plasma will screen against compounds which interact with or are inactivated by other plasma components. Correlation of the K_i with the extension of the PT is a necessary *in vitro* demonstration that potency in the free factor Xa inhibition assay translates into potency in a clinical coagulation assay. In addition, extension of the PT in citrated plasma can be used to measure duration of action in subsequent pharmacodynamic studies.

For further information on assays to demonstrate the activity of the compounds of the invention, see R. Lottenberg *et al.*, *Methods in Enzymology* (1981), Vol. 80, pp. 341-361, and H. Ohno *et al.*, *Thrombosis Research* (1980), Vol. 19, pp. 579-588.

Administration of the compounds of the invention, or their pharmaceutically acceptable salts, in pure form or in an appropriate pharmaceutical composition, can be carried out *via* any of the accepted modes of administration or agents for serving similar utilities. Thus, administration can be, for example, orally, nasally, parenterally, topically, transdermally, or rectally, in the form of solid, semi-solid, lyophilized powder, or liquid dosage forms, such as for example, tablets, suppositories, pills, soft elastic and hard gelatin capsules, powders, solutions, suspensions, or aerosols, or the like, preferably in unit dosage forms suitable for simple administration of precise dosages.

The compositions will include a conventional pharmaceutical carrier or excipient and a compound of the invention as the/an active agent, and, in addition, may include other medicinal agents, pharmaceutical agents, carriers, adjuvants, *etc.*

Generally, depending on the intended mode of administration, the

The preferred route of administration is oral, using a convenient daily dosage regimen which can be adjusted according to the degree of severity of the disease-state to be treated. For such oral administration, a pharmaceutically acceptable composition containing a compound(s) of the invention, or a pharmaceutically acceptable salt

The compounds of the invention, or their pharmaceutically acceptable salts, may also be formulated into a suppository using, for example, about 0.5% to about 50% active ingredient disposed in a carrier that slowly dissolves within the body, *e.g.*, polyoxyethylene glycols and polyethylene glycols (PEG), *e.g.*, PEG 1000 (96%) and PEG
30 4000 (4%).

Liquid pharmaceutically administrable compositions can, for example, be prepared by dissolving, dispersing, *etc.*, a compound(s) of the invention (about 0.5% to about 20%), or a pharmaceutically acceptable salt thereof, and optional pharmaceutical adjuvants in a carrier, such as, for example, water, saline, aqueous dextrose, glycerol,

ethanol and the like, to thereby form a solution or suspension.

If desired, a pharmaceutical composition of the invention may also contain minor amounts of auxiliary substances such as wetting or emulsifying agents, pH buffering agents, antioxidants, and the like, such as, for example, citric acid, sorbitan
5 monolaurate, triethanolamine oleate, butylated hydroxytoluene, *etc.*

Actual methods of preparing such dosage forms are known, or will be apparent, to those skilled in this art; for example, see *Remington's Pharmaceutical Sciences*, 18th Ed., (Mack Publishing Company, Easton, Pennsylvania, 1990). The composition to be administered will, in any event, contain a therapeutically effective amount of a
10 compound of the invention, or a pharmaceutically acceptable salt thereof, for treatment of a disease-state alleviated by the inhibition of factor Xa in accordance with the teachings of this invention.

The compounds of the invention, or their pharmaceutically acceptable salts, are administered in a therapeutically effective amount which will vary depending upon a
15 variety of factors including the activity of the specific compound employed; the metabolic stability and length of action of the compound; the age, body weight, general health, sex, and diet of the patient; the mode and time of administration; the rate of excretion; the drug combination; the severity of the particular disease-states; and the host undergoing therapy. Generally, a therapeutically effective daily dose is from about
20 0.14 mg to about 14.3 mg/kg of body weight per day of a compound of the invention, or a pharmaceutically acceptable salt thereof; preferably, from about 0.7 mg to about 10 mg/kg of body weight per day; and most preferably, from about 1.4 mg to about 7.2 mg/kg of body weight per day. For example, for administration to a 70 kg person, the dosage range would be from about 10 mg to about 1.0 gram per day of a
25 compound of the invention, or a pharmaceutically acceptable salt thereof, preferably from about 50 mg to about 700 mg per day, and most preferably from about 100 mg to about 500 mg per day.

Preparation of Compounds of The Invention

30 As a matter of convenience, the following description of the preparation of the compounds of the invention is directed to the preparation of compounds of formula (I) where A is -N=, Z¹ and Z² are both -O-, R² is -C(NH)NH₂, and R⁷ is -S(O)_n-(C(R¹²)(R¹³))_p-R¹⁶ where n and p are both 0, and R¹⁶ is phenyl substituted by R¹¹,

where R^{11} is as defined above in the Summary of the Invention. It is understood, however, that similar synthetic processes may be used to prepare other compounds of formula (I), (II), (III), (IV), (V), (VI), and (VII). It is also understood that in the following description, combinations of substituents and/or variables (*e.g.*, R^{12} and R^{13}) on the depicted formulae are permissible only if such combinations result in stable compounds.

A. Preparation of Compounds of Formula (Ia)

Compounds of formula (Ia) are compounds of formula (I) where A is $-N=$, Z^1 and Z^2 are both $-O-$, R^2 is $-C(NH)NH_2$, and R^7 is $-S(O)_n-(C(R^{12})(R^{13}))_p-R^{16}$ where n and p are both 0, and R^{16} is phenyl substituted by R^{11} , where R^{11} is as defined above in the Summary of the Invention, and may be prepared as illustrated below in the Reaction Scheme, where each X is independently halo; and R^1 , R^3 , R^4 , R^5 , R^6 and R^{11} are as described above in the Summary of the Invention:

REACTION SCHEME

The mercapto compounds of formula (B) are commercially available, for example from Aldrich Chemical Co., Sigma Chemical Co., or ICN Biomedicals, Inc, or may be prepared according to methods known to those skilled in the art. In addition, other sulfur compounds of the formula $\text{HS(O)}_n\text{-(C(R}^9\text{)(R}^{10}\text{))}_m\text{-R}^{11}$ (where n is 0 and m is 1 to 4) or the formula $\text{HS(O)}_n\text{-(C(R}^{12}\text{)(R}^{13}\text{))}_p\text{-R}^{16}$ (where n is 0 and p is 0 to 4) where each R^9 , R^{10} , R^{11} , R^{12} , and R^{13} are defined above in the Summary of the Invention, are also commercially available, for example, from Aldrich Chemical Co., Maybridge Co., and Jannsen Co., or may be prepared according to methods known to those skilled in the art, and may be similarly used in the above Reaction Scheme in place of the compound of formula (B) to produce the corresponding compounds invention where R^7 is $\text{-S(O)}_n\text{-(C(R}^9\text{)(R}^{10}\text{))}_m\text{-R}^{11}$ (where n is 0 and m is 1 to 4) or $\text{-S(O)}_n\text{-(C(R}^{12}\text{)(R}^{13}\text{))}_p\text{-R}^{16}$ (where n is 0 and p is 0 to 4) where each R^9 , R^{10} , R^{11} , R^{12} , R^{13} and R^{16} are defined above in the Summary of the Invention. The compounds of formula (A), (D), and (F) are commercially available, for example, from Aldrich Chemical Co., or may be prepared according to methods known to those skilled in the art.

In general, the compounds of formula (Ia) are prepared by first treating a compound of formula (A) with a compound of formula (B) in an aprotic solvent, for example, DMSO, in the presence of a base, for example, triethylamine, at -20°C to 50°C , preferably at ambient temperature, for about 20 to 40 hours. The compound of formula (C) is then isolated from the reaction mixture by standard techniques, such as extraction, filtration and *in vacuo* removal of solvent.

The resulting compound of formula (C) in an aprotic solvent, for example, acetonitrile, is treated with an equimolar amount of a compound of formula (D) in the presence of a base, for example, cesium carbonate, at temperatures between about 20°C and 120°C , preferably at ambient temperature, for a period of time sufficient to complete the desired reaction as monitored by thin layer chromatography (TLC). The compound of formula (E) is then isolated from the reaction mixture by standard isolation techniques, such as extraction, *in vacuo* removal of solvent, and flash chromatography.

The compound of formula (E) in an aprotic solvent, for example, DMSO, is then treated with an equimolar amount of a compound of formula (F) in the presence of a base, for example, cesium carbonate, at temperatures between about 20°C and 120°C , preferably at about 35°C , for a period of time sufficient to complete the desired reaction, for example, for about 13 hours. The reaction mixture is cooled to ambient temperature and the compound of formula (G) is then isolated from the reaction mixture

through standard isolated techniques, such as extraction, *in vacuo* removal of solvent, and flash chromatography.

The compound of formula (G) is dissolved in an anhydrous alkanol, preferably ethanol, and then anhydrous mineral acid, preferably HCl, is added to the solution over
5 a period of time sufficient to incorporate the acid into the solution while maintaining the reaction temperatures at about -78°C. After incorporation is complete, the reaction vessel is sealed and the reaction mixture is allowed to warm to ambient temperature and stirred between 12 and 24 hours, preferably for about 16 hours. The solvent is removed *in vacuo* and the resulting residue is dissolved in fresh anhydrous alkanol,
10 preferably ethanol, and then treated with anhydrous ammonia (gas) at temperatures from between ambient temperature and about 100°C from about 1 to about 48 hours, preferably at about 60°C and for about 2 hours. The compound of formula (Ia) is then isolated from the reaction mixture by standard isolation techniques, for example, *in vacuo* removal of solvent and purification by high performance liquid chromatography
15 (HPLC).

Alternatively, instead of treating the resulting residue above with anhydrous ammonia (gas), the resulting residue may be treated with a compound of the formula $\text{NH}_2\text{OR}^{12}$ to afford the corresponding compound of formula (Ia) wherein R^2 is $-\text{C}(\text{NH})\text{N}(\text{H})\text{OR}^{12}$.

20 In addition, compounds of formula (Ia) may be treated under standard transesterification conditions with an alcohol of the formula R^{12}OH where R^{12} is aryl (optionally substituted by halo, alkyl, hydroxy, alkoxy, aralkoxy, amino, dialkylamino, monoalkylamino, nitro, carboxy, alkoxycarbonyl, aminocarbonyl, monoalkylaminocarbonyl, or dialkylaminocarbonyl) to produce compounds of the
25 invention where R^{12} is optionally substituted aryl.

Compounds of formula (Ia) wherein R^3 is $-\text{C}(\text{NH})\text{NH}_2$ or $-\text{C}(\text{NH})\text{N}(\text{H})\text{OR}^{12}$ are produced from the corresponding cyano compounds in a similar manner as that described above for compound of formula (G).

In addition, compounds of formula (Ia) wherein R^1 , R^3 , R^4 , R^5 , R^6 , R^9 , R^{11} , or
30 R^{16} contains a $-\text{C}(\text{O})\text{N}(\text{R}^{12})\text{R}^{13}$ group or a $-\text{C}(\text{O})\text{OR}^{12}$ group (where each R^{12} or R^{13} is independently alkyl, optionally substituted aryl or optionally substituted aralkyl) may be hydrolyzed under acidic conditions to prepare corresponding compounds of the invention where R^1 , R^3 , R^4 , R^5 , R^6 , R^9 , R^{11} , or R^{16} contains a $-\text{C}(\text{O})\text{OH}$ group.

In addition, compounds of formula (Ia) wherein R^1 , R^3 , R^4 , R^5 , R^6 , R^9 , R^{11} or R^{16}

contains a $-C(O)OR^9$ group where R^9 is hydrogen, alkyl, optionally substituted aryl or optionally substituted aralkyl may be amidated under standard amidation conditions to form the corresponding compounds of formula (Ia) where $R^1, R^3, R^4, R^5, R^6, R^9, R^{11}$, or R^{16} contains a $-C(O)N(R^9)R^{10}$ group where R^9 and R^{10} are independently hydrogen, alkyl, optionally substituted aryl or optionally substituted aralkyl.

In addition, compounds of formula (Ia) where $R^1, R^3, R^4, R^5, R^6, R^9, R^{12}, R^{13}$ or R^{15} contains a nitro group may be reduced under standard conditions to produce the corresponding compounds of formula (Ia) where $R^1, R^3, R^4, R^5, R^6, R^9, R^{12}, R^{13}$ or R^{15} contains an amino group, which can be treated with the appropriate alkylating agents or acylating agents to afford the corresponding compounds of formula (Ia) where $R^1, R^3, R^4, R^5, R^6, R^9, R^{12}, R^{13}$ or R^{15} contains $-N(R^{12})R^{13}$ or $-N(R^{12})C(O)R^{13}$ where each R^{12} and R^{13} is independently hydrogen, alkyl, optionally substituted aryl or optionally substituted aralkyl.

Compounds of formula (Ia) may be further treated with the appropriate acid halide, preferably acid chloride, or with the appropriate acid anhydride or an equivalent, to yield compounds of the invention wherein R^2 is $-C(NH)N(H)C(O)R^{12}$ where R^{12} is hydrogen, alkyl, optionally substituted aryl or optionally substituted aralkyl.

Alternatively, compounds of formula (Ia) may further be treated with carbamoyl chlorides or their equivalents to yield compounds of the invention where R^2 is $-C(NH)N(H)C(O)OR^{12}$ where R^{12} is described above in the Summary of the Invention.

Alternatively, compounds of formula (Ia) may be further treated with compounds of the formula $R^{15}-S(O)_2$ -imidazole (where R^{15} is described in the Summary of the Invention) in a polar solvent, such as methylene chloride, at ambient temperature to afford compounds of the invention where R^2 is $-C(NH)N(H)S(O)_2R^{15}$.

Alternatively, compounds of formula (Ia) may be further treated with an appropriately *N*- R^{12} -substituted phenylcarbamate in a polar solvent, preferably methylene chloride, at ambient temperature, for about 6 to 24 hours, preferably for about 12 hours, to afford compounds of the invention where R^2 is $-C(NH)N(H)C(O)N(H)R^{12}$.

30 dissolved in absolute ethanol (20 mL) and cooled to -78°C and NH₃(g) was bubbled through the mixture for 5 minutes. The reaction vessel was sealed and the resultant mixture was stirred at 55°C. After 2.5 hours, the mixture was cooled to ambient temperature and concentrated *in vacuo*. Standard inhibitor compound stock solution:

5 mM in DMSO, stored at -20°C.

Test compounds (compounds of the invention) stock solutions:

10 mM in DMSO, stored at -20°C.

Assay procedure:

Assays were performed in 96-well microtiter plates in a total volume of 200 μ l. Assay components were in final concentration of 50 mM TrisHCl, 150 mM NaCl, 2.5 mM CaCl₂, 0.1% polyethylene glycol 6000, pH 7.5, in the absence or presence of the standard inhibitor or the test compounds and enzyme and substrate at following concentrations: (1) 1 nM factor Xa and 164 μ M S2222; (2) 20 nM thrombin and 300 μ M S2302; and (3) 10 nM tPA and 371 μ M S2288. Concentrations of the standard inhibitor compound in the assay were from 5 μ M to 0.021 μ M in 1 to 3 dilution. Concentration of the test compounds in the assay typically were from 10 μ M to 0.041 μ M in 1 to 3 dilution. For potent test compounds, the concentrations used in the factor Xa assay were further diluted 100 fold (100 nM to 0.41 nM) or 1000 fold (10 nM to 0.041 nM). All substrate concentrations used are equal to their K_m values under the present assay conditions. Assays were performed at ambient temperature.

The first step in the assay was the preparation of 10 mM test compound stock solutions in DMSO (for potent test compounds, 10 mM stock solutions were further

diluted to 0.1 or 0.01 mM for the factor Xa assay), followed by the preparation of test compound working solutions (4X) by a serial dilutions of 10 mM stock solutions with Biomek 1000 (or Multiprobe 204) in 96 deep well plates as follows:

- 5 (a) Prepare a 40 μ M working solution by diluting the 10 mM stock 1 to 250 in assay buffer in 2 steps: 1 to 100, and 1 to 2.5.
- (b) Make another five serial dilutions (1:3) of the 40 μ M solution (600 μ L for each concentration). A total of six diluted test compound solutions were used in the assay.

10 Standard inhibitor compound (5 mM stock) or DMSO (control) went through the same dilution steps as those described above for test compounds.

The next step in the assay was to dispense 50 μ L of the test compound working solutions (4X) (from 40 μ M to 0.164 μ M) in duplicate to microtiter plates with Biomek or MP204. To this was added 100 μ L of enzyme working solution (2X) with Biomek or MP204. The resulting solutions were incubated at ambient temperature for 10 minutes.

15 To the solutions was added 50 μ L of substrate working solution (4X) with Biomek or MP204.

The enzyme kinetics were measured at 405 nm at 10 seconds intervals for five minutes in a THERMOmax plate reader at ambient temperature.

Calculation of K_i of the Test compounds:

20 Enzyme rates were calculated as mOD/min based on the first two minutes readings. The IC_{50} values were determined by fitting the data to the log-logit equation (linear) or the Morrison equation (non-linear) with an EXCEL spread-sheet. K_i values were then obtained by dividing the IC_{50} by 2. Routinely, K_i (factor Xa) values less than 3 nM were calculated from the Morrison equation.

25 Compounds of the invention, when tested in this assay, demonstrated the selective ability to inhibit human factor Xa and human thrombin.

EXAMPLE 9

(*In vitro* assay for Human Prothrombinase)

30 This assay demonstrates the ability of the compounds of the invention to inhibit prothrombinase. Prothrombinase (PTase) catalyzes the activation of prothrombin to yield fragment 1.2 plus thrombin with meizothrombin as the intermediate. This assay is an end point assay. Activity of the prothrombinase is measured by activity of thrombin (one of the reaction products) or by the amount of thrombin formed/time based on a

thrombin standard curve (nM vs mOD/min). For determination of IC_{50} (PTase) of the compounds of the invention, PTase activity was expressed by thrombin activity (mOD/min).

- 30 (b) 25 nM Human factor Va: 5.08 μ L of Va stock (1 mg/mL) was diluted to final 1200 μ L with assay buffer.
- (c) 5 pM Human factor Xa: Dilute factor Xa stock (0.281 mg/mL) 1:1,220,000 with assay buffer. Prepare at least 1200 μ L.

Combine equal volumes (1100 μ L) of each component in the order of PCPS, Va

and Xa. Let stand at ambient temperature for 5 to 10 minutes and use immediately or store in ice (bring to ambient temperature before use).

2. 6 μ M Human prothrombin (FII): dilute 124 μ L of FII stock (4.85 mg/mL) to final 1400 μ L with assay buffer.

5 3. 20 mM EDTA/Assay buffer: 0.8 mL of 0.5 M EDTA (pH 8.5) plus 19.2 mL assay buffer.

4. 0.2 mM Spectrozyme-TH/EDTA buffer: 0.44 mL of SPTH stock (5 mM) plus 10.56 mL of 20 mM EDTA/assay buffer.

5. Test compounds (compounds of the invention):

10 Prepare a working solution (5X) from 10 mM stock (DMSO) and make a series of 1:3 dilution. Compounds were assayed at 6 concentrations in duplicate.

Assay conditions and procedure:

Prothrombinase reaction was performed in final 50 μ L of mixture containing PTase (20 μ M PCPS, 5 nM hFVa, and 1 pM hFXa), 1.2 μ M human factor II and varied
15 concentration of the test compounds (5 μ M to 0.021 μ M or lower concentration range). Reaction was started by addition of PTase and incubated for 6 minutes at room temperature. Reaction was stopped by addition of EDTA/buffer to final 10 mM. Activity of thrombin (product) was then measured in the presence of 0.1 mM of Spectrozyme-TH as substrate at 405 nm for 5 minutes (10 seconds intervals) at
20 ambient temperature in a THEROmax microplate reader. Reactions were performed in 96-well microtiter plates.

In the first step of the assay, 10 μ L of diluted test compound (5X) or buffer was added to the plates in duplicate. Then 10 μ L of prothrombin (hFII) (5X) was added to each well. Next 30 μ L PTase was added to each well, mix for about 30 seconds. The
25 plates were then incubated at ambient temperature for 6 minutes.

In the next step, 50 μ L of 20 mM EDTA (in assay buffer) was added to each well to stop the reaction. The resulting solutions were then mixed for about 10 seconds. Then 100 μ L of 0.2 mM spectrozyme was added to each well. The thrombin reaction rate was then measured at 405 nm for 5 minutes at 10 seconds intervals in a Molecular
30 Devices microplate reader.

Calculations:

Thrombin reaction rate was expressed as mOD/min. using OD readings from the five minute reaction. IC₅₀ values were calculated with the log-logit curve fit program.

The compounds of the invention demonstrated the ability to inhibit

pro-thrombinase when tested in this assay.

EXAMPLE 10

(*In vivo* assay)

The following assay demonstrates the ability of the compounds to act as
5 anti-coagulants.

Male rats (250-330 g) were anesthetized with sodium pentobarbital
(90 mg/kg, i.p.) and prepared for surgery. The left carotid artery was cannulated for
the measurement of blood pressure as well as for taking blood samples to monitor
clotting variables (prothrombin time (PT) and activated partial thromboplastin time
10 (aPTT)). The tail vein was cannulated for the purpose of administering the test
compounds (*i.e.*, the compounds of the invention and standards) and the thromboplastin
infusion. The abdomen was opened *via* a mid-line incision and the abdominal vena cava
was isolated for 2-3 cm distal to the renal vein. All venous branches in this 2-3 cm
segment of the abdominal vena cava were ligated. Following all surgery, the animals
15 were allowed to stabilize prior to beginning the experiment. Test compounds were
administered as an intravenous bolus ($t=0$). Three minutes later ($t=3$), a 5-minute
infusion of thromboplastin was begun. Two minutes into the infusion ($t=5$), the
abdominal vena cava was ligated at both the proximal and distal ends. The vessel was
left in place for 60 minutes, after which it was excised from the animal, slit open, the
20 clot (if any) carefully removed, and weighed. Statistical analysis on the results was
performed using a Wilcoxin-matched-pairs signed rank test.

The compounds of the invention, when tested in this assay, demonstrated the
ability to inhibit the clotting of the blood.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/EP 97/05231

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:
see FURTHER INFORMATION sheet PCT/ISA/210
2. ☒ Claims Nos.:
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
see FURTHER INFORMATION sheet PCT/ISA/210
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

Claims Nos.: 1-17

because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

The huge number of theoretically conceivable compounds resulting from the combinations of all the claimed substituent definitions prevents the search from being carried out comprehensively. It is noted that the examples illustrate the claimed invention for a specific range of values. Additionally such uncertainties on the claimed scope may introduce contradictions and render the unity questionable. Guided by the description, the search has been based on the illustration of the given examples (Art. 83, 84 EPC; Rule 45 EPC).

Remark : Although claim 18 is directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compounds.
